PEERPRINT · Roll Stickers Department

File Delivery Instructions for Roll Stickers

The roll stickers department has different requirements from the offset department. Go through the 17 steps, watch the short animation beside each one, and tick it off when you are done. When everything is ticked, your file is ready to send.

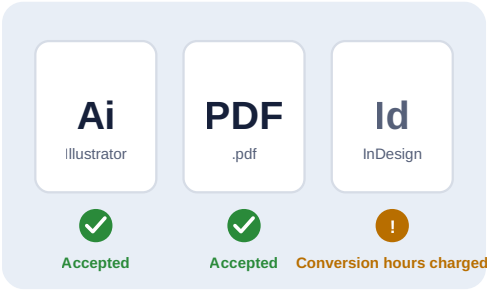

The file and the artwork

What to send and how to prepare the design

1 File format

Send Illustrator and/or PDF files. Other files, such as InDesign or images, incur conversion work hours, if they can be converted at all.

Linked images must be embedded or included with the file you send, at a resolution of at least 300 DPI.

Ai and PDF files are accepted directly

Please note: files created in artificial intelligence (AI) apps, and in programs such as Corel and Canva, are not compatible with Adobe PDF. They cause problems in preparing the file for production, so avoid them.

Colours: CMYK only

- **Send CMYK files only, not RGB.** If we have to convert from RGB to CMYK on our side, the colours in the final result may change, and not always in the direction you expected.
- **Pantone is not used in digital printing.** Pantone shades are converted to CMYK, so the printed colour may look different from the original Pantone.
- **Special ink, if available.** Special inks, for example silver or fluorescent ink, can be used, but only if available, and they must be requested in advance.

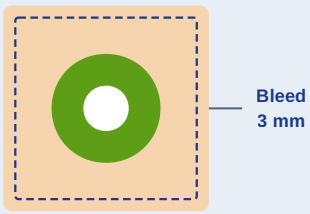

☐ I have finished this step

2 3 mm bleed

Extend the artwork at least 3 mm beyond the net size on every side. The bleed area continues the artwork that appears inside the net.

This prevents visible problems after cutting on the production machine.

☐ I have finished this step

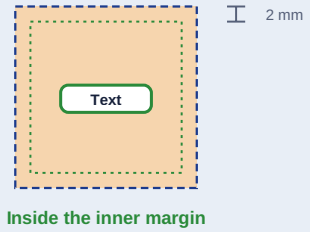

The dashed line is the net size; the colour continues beyond it

3 2 mm inner margin

Leave about 2 mm inside the cut line. In this area there should be only the background: no text and no other graphic objects.

☐ I have finished this step

Green frame = safe area for content

4 Convert text to outlines

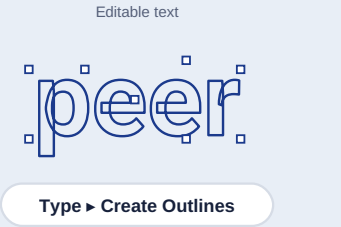

Convert all text to shapes (outlines).

In Illustrator: `Type ▸ Create Outlines`

Why convert text to outlines?

- **The font is not installed on our side.** The file is opened in production on another computer. Text that has not been converted is replaced with another font, and the shape, spacing and line breaks change.
- **Font licensing.** Many font licences restrict passing the font file to a third party. When the text becomes a shape there is no need to send the font at all. Check the licence terms of your font.
- **Keep an editable copy.** After conversion you can no longer edit the text, so also keep the original file on your side.

☐ I have finished this step

After conversion the text is a shape, not a font

Die cut and finishes

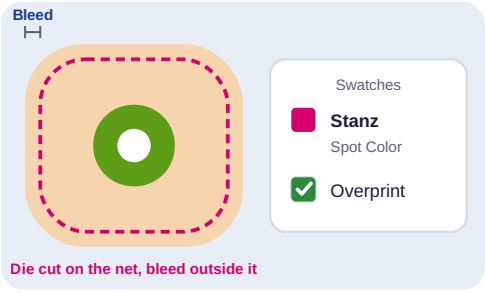

Spot colours, overprint and white mask

5 The die cut line

Place the die line above the artwork and define it as a spot colour named **Stanz** or **Diecut**. Mark it as overprint.

The die line marks the net, meaning the final sticker size, not the gross size (the artwork together with the bleed). The bleed is outside the die line.

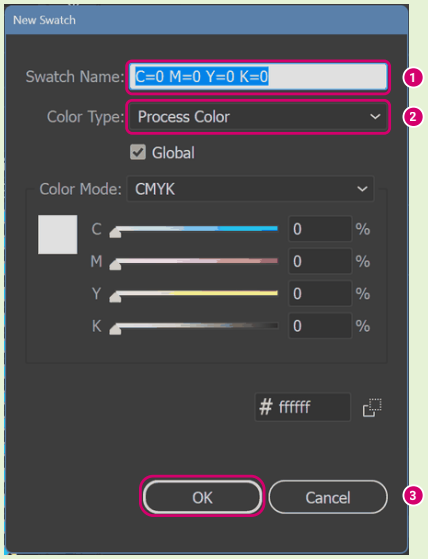

Overprint controls: `Window ▸ Attributes`

Pink line = die cut, on the net size

How to create a named spot colour in Illustrator

1. Open the Swatches panel: `Window ▸ Swatches`.
2. Click **New Swatch** (the button at the bottom of the panel, or in the panel menu).
3. In the **Swatch Name** field (marker 1 in the picture) type the name, for example **Stanz**.
4. In **Color Type** (marker 2), instead of Process Color, choose **Spot Color**, and confirm with **OK** (marker 3). The colour value itself is not important, and the new colour will appear in the swatch list.
5. Select the object (the die line) and click the new colour in the list to apply it.
6. In the **Attributes** panel, tick overprint.

Why is overprint needed?

By default, an object placed over artwork "cuts out" the artwork in production (knockout): in the area it occupies, whatever is underneath is removed and not printed. With overprint the object is added on top of what is underneath, and nothing is deleted.

That is why the die line, the finishes (Foil, Emboss) and the white mask are defined as spot colours set to overprint: they act as separate layers above the artwork, and the artwork beneath them stays intact, with no holes and no colour change in those areas.

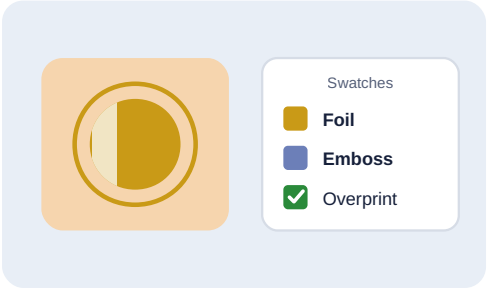

I have finished this step

6 Additional finishes

Every additional finish, for example Foil or Emboss, is defined as a separate spot colour with a name that describes it, and set to overprint. Create it exactly like the die-line colour in step 5, only with a different name, for example Foil.

Special colours such as white or silver are also defined as spot colours set to overprint.

I have finished this step

The spot name describes the finish

7 White mask (White)

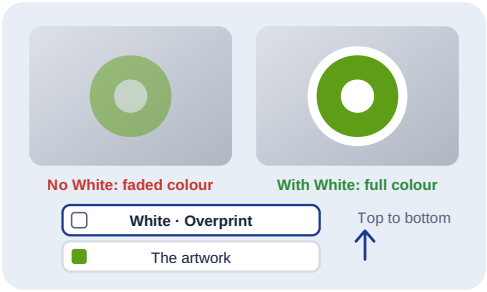

The white mask is a spot colour named **White**. All the areas that should be opaque white are included in it, including areas beneath process colours.

The white cancels the effect of the material on the colour: a silver or transparent material turns white in these areas.

The White layer must be above the artwork, and set to overprint.

Tip: A convenient way to manage a white mask is to use an Opacity Mask.

I have finished this step

White layer above the artwork, in overprint

8 Digital foil: minimum width

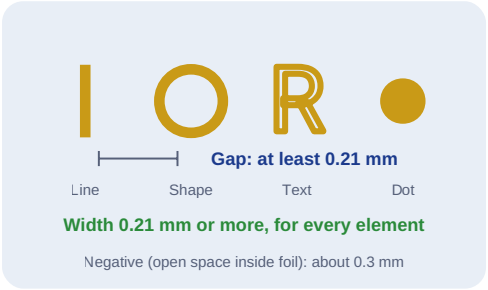

In digital foil, every element, whether a line, shape, text or dot, must be at least **0.21 mm** wide. The distance between elements must also be at least **0.21 mm**.

Digital foil cannot capture areas whose thickness approaches zero, for example thin serifs in text (small edges), so consult us in advance before choosing the font.

Digital foil that contains open elements inside it (negative) requires a greater thickness, of about **0.3 mm**.

Note: Conventional foil, with a dedicated die, can reach finer and smaller elements than digital foil. If your design includes fine details, contact us in advance and we will check which method suits.

☐ I have finished this step

All elements thicken to the minimum width

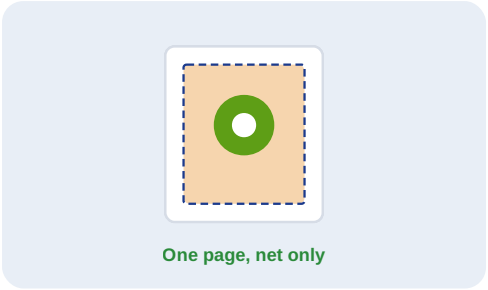

A tidy file One page, and a clear name

9 One page, no unnecessary elements

Do not supply multi-page files, unless it is variable data.

Do not leave elements unrelated to printing outside the net.

☐ I have finished this step

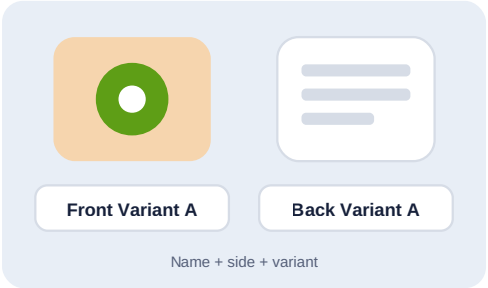

Delete whatever is outside the net and not for printing

10 File name

Give the files names that help us identify what they belong to, for example **Front Variant X** and **Back Variant X**.

☐ I have finished this step

Each file is identified by its name

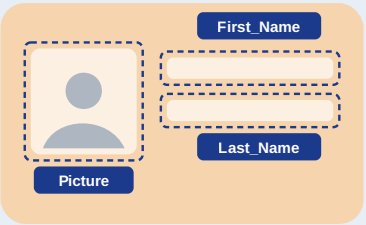

Variable data additions

Only if the job includes text or images that change from sticker to sticker

11 Marking object positions

Mark on the artwork the position of every object in the data table.

☐ I have finished this step

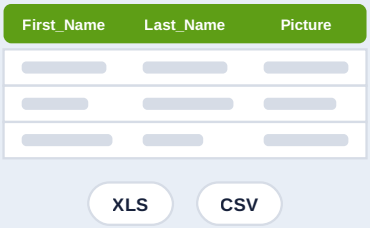

Every field in the table gets a marked place on the artwork

12 The data table

Send the data table as an **XLS** or **CSV** file.

☐ I have finished this step

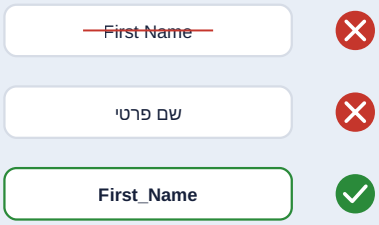

XLS or CSV

13 First row: object names

In the first row of the table write the object names. The names must be in English only and without spaces, for example **First_Name**.

☐ I have finished this step

English, no spaces, underscore instead of a space

14 How many records?

State how many records there are in the table.

☐ I have finished this step

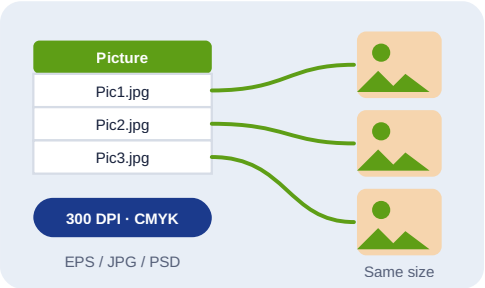

Write the number in the email or in the file name

15 Alternating images

Supply images at a resolution of **300 DPI** and in **CMYK** mode only, in EPS, JPG or PSD format. All images must be the same size.

In the data table, in the column named **Picture**, write the name of each image exactly, with the extension and without spaces.

☐ I have finished this step

File name in the table = file name in the folder

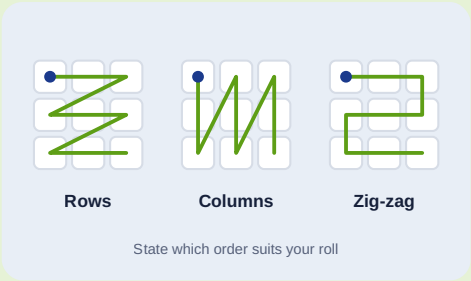

16 Data flow order

State the desired data flow order on the roll: row order, column order, zig-zag and so on.

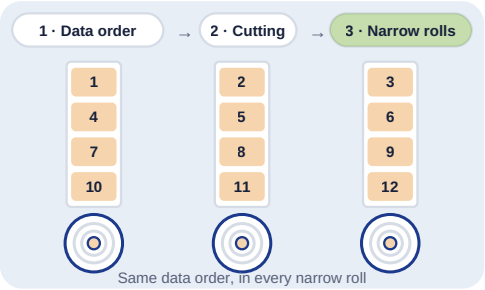

At the end of the process the wide roll is cut into narrow rolls, and the data appears on the stickers in the order you specified.

Examples of flow order

The blue dot marks the start of the order.

☐ I have finished this step

The wide roll is cut into narrow rolls, and they are the final product

17 Variable data in Hebrew

Variable data in Hebrew requires additional handling. Please state this requirement in advance.

☐ I have finished this step

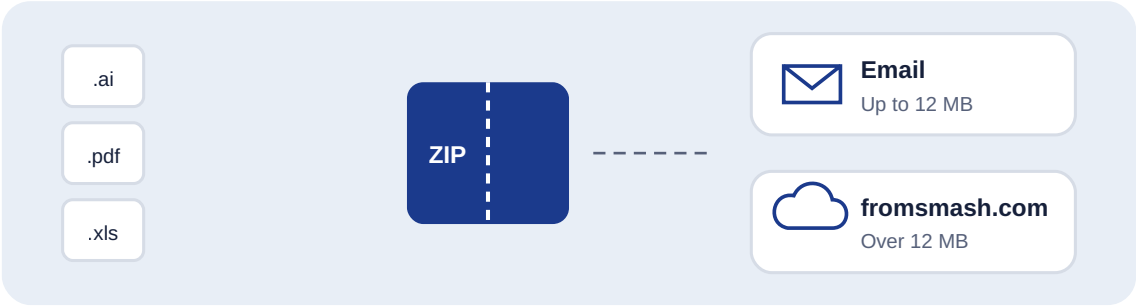

Hebrew is written in the opposite direction

Example of a variable data table

First_Name	Last_Name	Picture
Example	Example	\Pictures\Pic1.jpg

Sending the files How and where to send

Email address

Stickers@peerprint.com

You can send the files to this address.

Files over 12 MB

fromsmash.com Preferred

wormhole.app

wetransfer.com

Send through one of these sites, and prefer the first.

One combined file

ZIP / RAR / 7Z

Please avoid sending individual links shared in the cloud. Combine everything into one ZIP, RAR or 7Z file.

Please note: do not send Google Drive links. They are not compatible with our work environment.

For details or further help you can call: **+972-8-6226209/19** or send an email to **Stickers@peerprint.com**

Deviation from the stated instructions extends the file handling time and/or affects the job pricing.
